

Microneedling

BENEFITS

HOW DOES IT WORK?

Microneedling is a medical device using a pen like device, with an attached sterile, disposable cartridge tip containing small needles over the skin's surface. a multitude of very thin and sharp

needle tips to make punctures on the skin not visible to the naked eye.

These tiny punctures stimulate tissue regeneration through the process called Collagen Induction Therapy (CIT) which improves the appearance of skin.

It's an organic treatment that's suitable for all skin types.

BENEFITS:

- Reduction in deep wrinkles and fine lines
- Reduces acne scars
- Reduces stretchmarks
- Revitalises dry skin and elevates the overall texture and health of your skin
- Firms skin
- Makes products far more effective through punctures in the skin

- CIT (Collagen Induction Therapy) boosts collagen and keeps you looking youthful longer. Collagen plays a vital role in tattoo healing and a crucial factor in tattoo longevity since skin drying, sagging or wrinkling will automatically jeopardise the quality of your tattoo.

- Reduces rosacea discolouring by stimulating the epidermis, reducing the appearance of vessels beneath the skin and overall redness, while reinforcing collagen in vessel walls and connective tissue that support vessels.

- Faster results for aged/dry skin rejuvenation using Hyaluronic acid to hydrate the skin puts the skin in better condition.

- Hydrated skin allows the skin to become more resilient which helps allow the tattoo ink application to be easier.

- Dry skin may tighten up, making it easier to crack and peel and could affect your results once healed. For dry and aged skin, brow micro-pigmentation 4-6 weeks before your tattoo treatment is highly recommended.

For all body scars contact us for a quote.

Day 1: What to expect?

- Swelling and redness
- Some may experience skin flaking

If you peel, don't apply make-up for 48hrs-continue with aftercare for your skin.
